

Emergency Start via Master Starting Valve

M32

The classification societies require a possibility for emergency start directly on the engine. For this reason a mechanical emergency start button is arranged on the master starting valve.

According to classification society regulations the emergency start systems must work without intervention of the safety system. By actuating the emergency start button the entire automatic starting interlock is, therefore, bypassed! Starting air is then admitted directly to the engine, even with barring device engaged and/or other starting interlock criteria.

In order to prevent operating errors and the related risks, a warning sign is to be fitted to the master starting valve at a clearly visible position.

Notstart Emergency Start

**Achtung, keine automatische
Startverblockung!**
**Attention, no automatic
starting interlock!**
